In The Claims:

Please amend claims as follows:

1. (Original) A bidirectional promoter for expression of at least two coding sequences in opposite direction in animal cells comprising 5' end to 3' end:

- a) a first minimal promoter sequence derived from cytomegalovirus (CMV) or mouse mammary tumor virus (MMTV) genomes;
- b) a full efficient promoter sequence derived from an animal gene;

the two promoter sequences driving a coordinate transcription of said coding sequences in the opposite orientation.

- 2. (Original) The bidirectional promoter according to claim 1 wherein the full efficient promoter sequence consists of an enhancer region and a second minimal promoter sequence.
- 3. (Original) The bidirectional promoter according to claim 1 wherein the full efficient promoter sequence derives from ubiquitously expressed genes comprising the phosphoglycerate kinase or the ubiquitin gene.
- 4. (Currently Amended) A bidirectional expression cassette essentially comprising the bidirectional promoter according to previous claims 1, convenient insertion sites positioned downstream to each promoter, and polyadenylation sites positioned downstream to each insertion site.
- 5. (Original) The bidirectional expression cassette according to claim 4 further comprising at least one post-transcriptional

regulatory element positioned upstream to one or each polyadenylation site.

- 6. (Currently Amended) The bidirectional expression cassette according to claim 4 or 5 further comprising at least one internal ribosome entry site (IRES) sequence to express three or more genes.
- 7. (Currently Amended) An expression construct containing the bidirectional promoter according to claim 1 or 2.
- 8. (Currently Amended) An expression construct containing the bidirectional expression cassette according to claims 4-6.
- 9. (Currently Amended) A gene transfer expression vector containing the expression construct according to claims 7 or 8 further comprising lentiviral or retroviral sequences.
- 10. (Currently Amended) Use of A Method for the delivery and expression of multiple genes in animal cells comprising the gene transfer expression vector according to claim 9 for the delivery and expression of multiple genes in animal cells.
- 11. (Currently Amended) Use of the gene transfer expression vector The Method according to claim 10 wherein animal cells are tissue animal cells in ex vivo.
- 12. (Currently Amended) Use of the gene transfer expression vector The Method according to claim 11 wherein tissue animal celles are comprising brain neurons.

- 13. (Currently Amended) \underline{A} Method for the coordinate expression of two exogeneous coding sequences into an animal cell comprising the following steps:
- a) cloning said coding sequences into the gene transfer expression vector according to claim 9, each coding sequence under the control of one of the two promoters of the bidirectional promoter;
- b) transforming animal cells by means of said vectors; and
- c) allowing the expression of the vector.
- 14. (Currently Amended) <u>The</u> Method for the coordinate expression of two exogeneous coding sequences according to claim 10 wherein the animal cell is an human cell.
- 15. (Currently Amended) The Method for the coordinate expression of two exogeneous coding sequences according to claim 14 wherein the human cell is a retransplantable human cell.
- 16. (Currently Amended) <u>The</u> Method for the coordinate expression of two exogeneous coding sequences according to claim 15 wherein the retransplantable human cell is an hematopoietic cell.
- 17. (Currently Amended) A Method for generating a transgenic non human organism comprising the step of transforming appropriate cells with an expression construct containing the bidirectional cassette according to claims 7 or 8.

On a new page after the claims, please add the below paragraph starting on line 1:

LENTIVIRAL VECTORS CARRYING SYNTHETIC BI-DIRECTIONAL PROMOTERS AND USES THEREOF

ABSTRACT OF THE INVENTION

-- It is described a bidirectional promoter for expression of at least two coding sequences in opposite direction in animal cells; bidirectional expression cassettes; expression constructs; gene transfer expression vectors; and methods for the use thereof.--
